Summary

Software engineer building practical AI systems and developer tools across Python, Go, and TypeScript, with upstream contributions reviewed by maintainers of better-auth and go-ethereum.

Experience

Software Engineer, Independent engineering – Remote May 2025 – present

- Proposed a request-scoped skip flag and regression test for an email-enumeration leak in better-auth; maintainers adopted the approach and shipped it in [#5998](#).
- Designed a go-ethereum archive-node command that binary-searches the merge block, preserves headers and hashes, and drops pre-merge bodies; revised it across three core-maintainer review rounds, after which the core team built its own version.
- Shipped POSTDATED, which turns hospital paperwork into predicted insurance disallowances while recoverable gaps can still be fixed, using Cerebras Chat Completions (gemma-4-31b) for extraction and 38 tests on the money and guard paths.
- Built Fuzz, a real-time text-degradation game that captures restored words at their exact fuzz level; each round makes at most one model call, and the original text never crosses the server boundary.

Software Engineer, Accenture – Bangalore, Karnataka, India July 2021 – July 2022

- Developed a Python ETL script that automated data-processing workflows, saved 50 labor hours monthly, and reduced processing errors.
- Implemented a GitHub Actions CI/CD pipeline.

Upstream Impact

better-auth — email enumeration at sign-in 2025 · Security

- Traced an account-enumeration leak to the Have I Been Pwned plugin throwing during the dummy-password hash; proposed a request-scoped skip flag and regression test. Maintainers adopted the approach and shipped it in [#5998](#).

go-ethereum — geth db truncate-freezer 2025 · Systems

- Designed an archive-node command that binary-searches the merge block, preserves headers and hashes, and removes pre-merge bodies; revised it across three core-maintainer review rounds to batch work instead of retaining roughly 15 GB in memory. The core team built its own version.

Selected Projects

POSTDATED 2026 · Flagship

Next.js, TypeScript, React, Cerebras Chat Completions (gemma-4-31b), Vitest

- Selected as one of approximately 150 builders from 5,000+ applications (about 3%) for the five-hour Push to Prod hackathon in Bengaluru.
- Turns hospital paperwork into predicted insurance disallowances while recoverable gaps can still be fixed, converting each line into a document request or question for the doctor.
- Separated multimodal extraction from deterministic policy arithmetic and a negation-aware medical-claim guard; covered the money and guard paths with 38 tests.

Fuzz 2025 · Project

Bun, TypeScript, Python, FastAPI, Hugging Face

- Built a real-time text-degradation game that captures restored words at their exact fuzz level; each round makes at most one model call, and the original text never crosses the server boundary.

Education

University of Alabama at Birmingham, MS in Computer Science – Birmingham, AL, USA Aug 2023 – May 2025

BV Raju Institute of Technology, BS in Computer Science – Medak, Telangana, India Aug 2017 – June 2021

Skills

Languages: Python, Go, TypeScript, JavaScript, C, SQL

Systems and Services: Linux, Docker, GitHub Actions, CI/CD, HTTP servers, REST APIs, memory management

AI: RAG, LLM integration, multimodal AI, PyTorch, Hugging Face

Continuing Education

Boot.dev — selected completed coursework: HTTP Servers in Go, Retrieval Augmented Generation, CI/CD with GitHub Actions and Docker, Memory Management in C, SQL
